

Swipe to Export

Intelligent Matchmaking Algorithm for Global Trade

Problem Definition

Global exporters and international buyers are surrounded by massive volumes of trade data but consistently fail to identify the right business opportunities at the right time. Traditional trade marketplaces rely on static listings, manual filtering and keyword-based search — resulting in irrelevant matches, low-quality leads and slow deal cycles. The real challenge is not the lack of data, but the lack of intelligent evaluation, cleaning, scoring and matchmaking powered by real-world EXIM signals. This project aims to solve that by building an adaptive, algorithm-first matchmaking platform — **Swipe to Export** — that transforms raw trade data into meaningful, explainable and outreach-ready business connections.

- 1 Data overload without intelligence**
Exporters have access to thousands of buyer records but no system to rank, score or surface the most relevant ones — leading to wasted time and missed opportunities.
- 2 Static, keyword-only matching**
Existing platforms rely on simple keyword search and category filters, which fail to capture real trade intent signals such as import history, expansion trends and buyer activity.
- 3 No explainability in suggestions**
Current tools do not explain why a buyer is suggested, making it impossible for exporters to trust or act on a recommendation confidently.
- 4 Absence of real-time adaptation**
Matchmaking scores are static and never evolve based on user behaviour, swipe signals or changing market patterns — causing the system to become stale quickly.

5

Manual, generic outreach

After identifying a potential buyer, exporters must manually draft cold outreach with no context — resulting in low response rates and lost deal momentum.

6

Proposed solution

Build a data-driven matchmaking engine that ingests multi-source EXIM and firmographic data, cleans and scores it across criteria such as product fit, geography, trade frequency and buyer intent, presents matches through a swipe-style UI with explainable scores, and continuously adapts using real-time feedback — with outreach automation built in.
